

FUSED AI WHITEPAPER

From Tweet to Token: The AI-Native Asset Launchpad

Technical Specification and Dual-Phase Economic Architecture

1. EXECUTIVE SUMMARY AND MULTI-CHAIN VISION

FUSED AI is an AI-native launch platform designed to convert social media content and creative concepts into fully deployed on-chain digital assets within minutes. By removing manual engineering bottlenecks from token creation, FUSED AI democratizes access to decentralized finance while building robust infrastructure across high-growth EVM ecosystems, including **Robinhood Chain** and **Arc**.

Traditional launchpads focus solely on initial token generation, often leaving projects vulnerable to liquidity fragmentation and immediate creator exit. FUSED AI addresses this through an integrated launch engine and a dual-phase economic engine engineered for long-term creator retention and auto-compounding protocol liquidity.

2. THE TWEET-TO-TOKEN LAUNCH ENGINE

The core innovation of FUSED AI is its automated pipeline that transforms simple tweets or text prompts into production-grade smart contracts and decentralized liquidity pools. The engine operates through four automated stages:

Key Engine Capabilities:

- **Concept AND Ticker Allocation:** Context-aware token naming algorithms paired with ticker uniqueness checks.
- **Automated Visual Branding:** Generative AI artwork pipelines creating high-resolution logos and visual identity packages.
- **On-Chain Metadata AND Configs:** Standardized JSON metadata generation, contract parameterization, and automated deployment setups.
- **Ultra-Low-Cost Deployment:** Gas-optimized factory smart contracts ensuring minimal deployment friction across EVM networks.

3. DUAL-PHASE TOKENOMICS AND FEE ARCHITECTURE

FUSED AI introduces a sustainable dual-phase fee engine designed to balance initial price discovery with deep, permanent liquidity upon market maturity.

Phase	Fee	Fee Split Breakdown	Liquidity Structure
Bonding Curve Phase	1.0%	• 0.3% Creator Share • 0.7% FUSED Treasury	Dynamic algorithmic bonding curve providing initial price discovery.
Post-Graduation Phase (Uniswap V4)	1.0%	• 70% Creator Share • 10% FUSED Treasury • 20% Auto-Compounding LP	Permanently locked NFT LP position with automated fee re-investment.

Table 1: Dual-Phase Protocol Fee Architecture and Liquidity Mechanics.

4. CREATOR ALIGNMENT AND LIQUIDITY COMPOUNDING

FUSED AI aligns creators with project longevity through the **'Rewards for Life'** framework. Traditional launch platforms compensate creators only during initial token issuance, leading to high churn. By securing a 70% share of ongoing post-graduation Uniswap V4 LP fees for creators, FUSED AI turns project leaders into perpetual stakeholders.

Simultaneously, the 20% auto-compounding LP allocation ensures that total protocol liquidity deepens continuously over time without diluting token holders, reducing slippage and strengthening price floor resilience.

5. STRATEGIC PARTNERSHIPS AND ALLOCATION

To maximize token distribution and market liquidity, FUSED AI integrates directly with top-tier DEX protocols, market makers, and ecosystem incubation pools across target chains like Robinhood Chain and Arc. Strategic presale structures ensure fair distribution, anti-snipe protection, and transparent treasury accounting across all launches.
